

NUBI 4.0 TEST CAPSULE

OPERATION

The NBCT test capsule is compatible with all NUBI 4.0 devices. It simulates the operation of the smoke canister, instead of delivering smoke it turns on its LEDs and emits an acoustic signal with the internal buzzer.

It has the same dimensions as a smoke capsule, is housed in the same place and connects to the same connector on the motherboard.

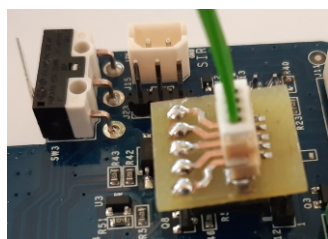

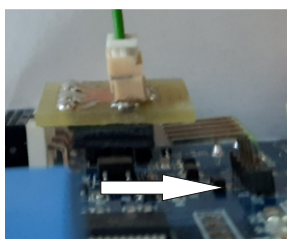

WORKS IMMEDIATELY

In NUBI 4.0 Plug & Play products or in the latest generation standard ones (NB40F3 - NB40LP2 - NB40S2 - NB40LPS2), the test capsule bypass the safety time after power-up.

Using the test capsule, it is therefore possible to simulate the operation of the product from the first moment after power-up.

The test capsule is housed in the same place as the smoke canister.

Connect the test capsule to the motherboard smoke canister connector.

HOW TO USE

Place the test capsule in its housing and connect it on the motherboard to the smoke canister connector.

BATTERY POWERED MODELS

NBCT has an extremely low power consumption and can be left connected to the device for a long time without significantly affecting the life of the battery.
